Peter Sallay, MD

Research:

Dr. Sallay is currently working on several research projects mainly focused on better evaluating the outcome of various shoulder surgeries. A recent investigation focused on improving the management of post-operative pain after shoulder surgery using a "pain pump". He has recently implemented a computerized system, which relies on handheld PDAs to collect patient data for more efficient and rapid care. This information will also be used for prospective studies so that more can be learned about the factors that affect the outcome of treatments.
